

# APEX [n.]

While it generally means the highest point of something, in racing, it's the innermost point of a turn. Hitting the **apex** perfectly allows for the flattest path, leading to better car control and higher exit speeds.

## EXAMPLE:

"The lead driver accelerated toward the final turn with a rival tailgating him; if he hits the **apex** perfectly, he'll carry the speed needed to secure the win."

This is the apex

# FLAT-OUT [adv.]

To take a turn at full throttle without touching the brakes or lifting off the gas. It demonstrates the absolute limit of the car's grip and the driver's commitment.

## EXAMPLE:

"The driver knew that the only way to gain the speed needed to overtake P1 was to take the final turn **flat-out**, risking the entire race on the very last lap."

This turn could be taken **flat-out**

# DIRTY AIR [n.]

Turbulence created by the aerodynamics of a leading car. This causes the following car to lose front-end downforce and traction, resulting in lower cornering speeds and increased understeer.

## EXAMPLE:

"Stuck in the **dirty air** of the leading car, the driver knew it was impossible to attempt an overtake in the next high-speed turn due to the sudden loss of front-end grip."

This car is stuck in **dirty air**

# KERBING [v.]

The act of driving over the raised, striped boundaries of the track to widen the racing line. This allows the driver to take a shallower arc through the corner, resulting in a flatter path and significantly higher exit speeds.

## EXAMPLE:

This car is **kerbing**

"The stewards did not issue a penalty to Max Verstappen, as he was merely **kerbing** and had not actually exceeded the track limits."

**Note:** Kerbing is the standard British spelling used in F1 and international racing. In the US, it is written as **curbing**.

# CHICANE [n]

A series of turns shaped like the letter "S."  
Its main function is to slow down cars before a high-speed section.

This is the **chicane** turn

## EXAMPLE:

"as the driver was approaching the **chicane** he slowed down to avoid exceeding the track limits"

## Examples of chicanes

Wall of Champions (Montreal): A high-speed chicane famous for many world champions crashing into its exit wall.

Variante del Rettifilo (Monza): An incredibly tight first-corner chicane after a massive high-speed straight.

Bus Stop (Spa-Francorchamps): A famous chicane that ends the lap at the Belgian Grand Prix.

# LOCK-UP [n]

A state where braking is so strong that the wheels stop rotating while the car is still moving. This causes the tires to slide across the track, creating "flat spots" and heavy smoke.

## EXAMPLE:

"the driver braked so hard that he caused the car to lock up causing him to crash straight into the wall"

This car's wheel **locked up**

# DOWNFORCE

The aerodynamic force created by the car's wings and bodywork that pressures the car down toward the track, providing the car with more grip through high-speed corners.

## EXAMPLE:

"The driver braked so hard that he caused the car to lock up causing him to crash straight into the wall"

This is an illustration of downforce

# TELEMETRY<sup>[n]</sup>

The real-time wireless transmission of data from a car's sensors to engineers in the pit lane, used to monitor performance, mechanical health, and race strategy.

This is the telemetry data

## EXAMPLE:

"The engineers analyzed the telemetry to see why the car was losing speed in the corners."

**STICKER CHALLENGE:** Match the racing concepts from the page ahead to the descriptions below.

"The driver applied too much pressure too quickly, causing the front tires to stop rotating while the car was still moving. This created a flat spot on the rubber and a thick cloud of white smoke."

"By shaping the car like an upside-down airplane wing, we've forced the air to push the chassis toward the ground. This invisible weight allows the driver to take high-speed corners at full throttle."

**STICKER CHALLENGE:** Match the racing concepts from the page ahead to the descriptions below.

"To maintain the highest possible exit speed, the driver must clip this exact point on the inside of the turn. Missing it by just a few inches ruins the entire racing line."

"We are receiving live streams of every gear shift, temperature change, and throttle input. This allows the engineers in the garage to fix problems before the driver even feels them."

## MAIN STICKERS:

## EXTRA STICKERS:

"Every lap is a lesson; every apex is an opportunity.  
Drive to be remembered, not just to finish."
